Постановка задачи

Приобретение практических навыков диагностики работы программного обеспечения.
Используемое средство диагностики — утилита strace.

Демонстрация полного функционала утилиты strace на примере ЛР №2

Strace - это утилита для диагностики, отладки и поиска неисправностей программ для Linux. Она используется для мониторинга взаимодействиями между процессами и ядром Linux, которые включают в себя системные вызовы, доставку сигналов и изменение состояния процесса. Работа strace становится возможной благодаря функции ядра, известной как ptrace.

Отслеживание дочерних процессов:

Отслеживать дерево процессов целиком помогает флаг -f, с которым strace отслеживает системные вызовы в процессах-потомках. К каждой строке вывода при этом добавляется pid процесса, делающего системный вывод:

```
kivi@LAPTOP-DGOM1IRE:~/os/lab_2/lab2/l2$ strace -f -e trace=pipe ./lab2 child1 child2

```
pipe([3, 4]) = 0

Трассировка вызовов запущенного процесса:

Для подключения к уже работающему процессу — используется опция -p.

Запустим `main` и оставим его ожидать входные данные. Узнаем его PID и подключимся к нему в другой консоли

```
kivi@LAPTOP-DGOM1IRE:~/os/lab_2/lab2/l2$ ps -a
```

```
PID TTY      TIME CMD
1973 pts/3    00:00:00 lab2
1992 pts/4    00:00:00 ps
```

Статистика системных вызовов: С помощью опции -c — можно получить наглядную статистику выполнения программы:

```
kivi@LAPTOP-DGOM1IRE:~/os/lab_2/lab2/l2$ strace -c ./lab2
```

Выводы

По мере выполнения данной лабораторной работы я освоил диагностику работы ПО с помощью утилиты strace — простого и надёжного инструмента. Strace позволяет отслеживать выполнение системных вызовов и сигналов к ядру системы. Ее функционал прост, но широк; работать с ней комфортно и, главное, полезно. Я научился просматривать как все вызовы сразу, так и несколько отдельных; получилось отследить работу и дочерних процессов. Научился отображать названия, пути к файлам, с которыми работает программа, вместо дескрипторов. Получилось взглянуть на удобную статистику системных вызовов и наблюдать время выполнения (обычное и относительное) тех или иных вызовов. Смог подключиться к уже запущенному процессу. Все это — лишь малая часть функционала утилиты strace. С ее помощью можно делать еще много интересных вещей: намеренно ломать программу (инъекция ошибок) для выявления уязвимостей,

наблюдать стек процесса в момент системного вызова и другое. Но больше всего мне понравилась возможность отследить время тех или иных вызовов, т.к. это в будущем позволит определить, в каком участке кода программа могла заикнуться; или понять, в каком месте стоит произвести оптимизацию. Также интересной и полезной я нахожу возможность отобразить статистику системных вызовов в удобной форме, в виде таблицы.
